

UTS Wireless

Anand Kumria

wildfire@progsoc.org

1. Access

The UTS wireless system will allow anyone to authenticate and all HTTP requests are then intercepted. You will be then be redirected to a webpage where you can use your UTS email address and password.

2. Bluesocket

Unfortunately UTS have a *custom* wireless client. In reality the client is an IPSec configuration tool (available for only Windows and Mac OS).

According to the documentation available with the Mac OS version, the default password is (of course) *password*.
